Admissions demand. Operational priorities.

Available data: 2026-01-01 to 2026-09-15 | Cairo local time

A decision-oriented analysis of admission-related inbox conversations. The purpose is to identify high-reach information needs, recurring contacts, and response observations that merit review - without mistaking message activity for enrollment.

Candidate visits	Fees / eligibility	Same-topic returns
12,016	**67.8%**	**1,339**
Not confirmed applicants	Unique visit reach	Later candidate visits

The three findings that matter

1. Decision information has broad reach. Fees or eligibility appear in 8,142 candidate visits (67.8%). Improving the clarity of these answers is a high-reach hypothesis to test; the data does not prove that these questions caused lost applications.

2. Repeated topics create a measurable review base. 1,339 later visits repeat a previously mentioned topic and contain 6,244 inbound messages. Some may be normal follow-up. Review context before classifying them as avoidable.

3. Response coverage and resolution are different questions. 313 mature query visits have no content-bearing reply within 24 hours. The observed median among mature replied visits is 19 sec; neither measure establishes whether guidance was correct or the matter was resolved.

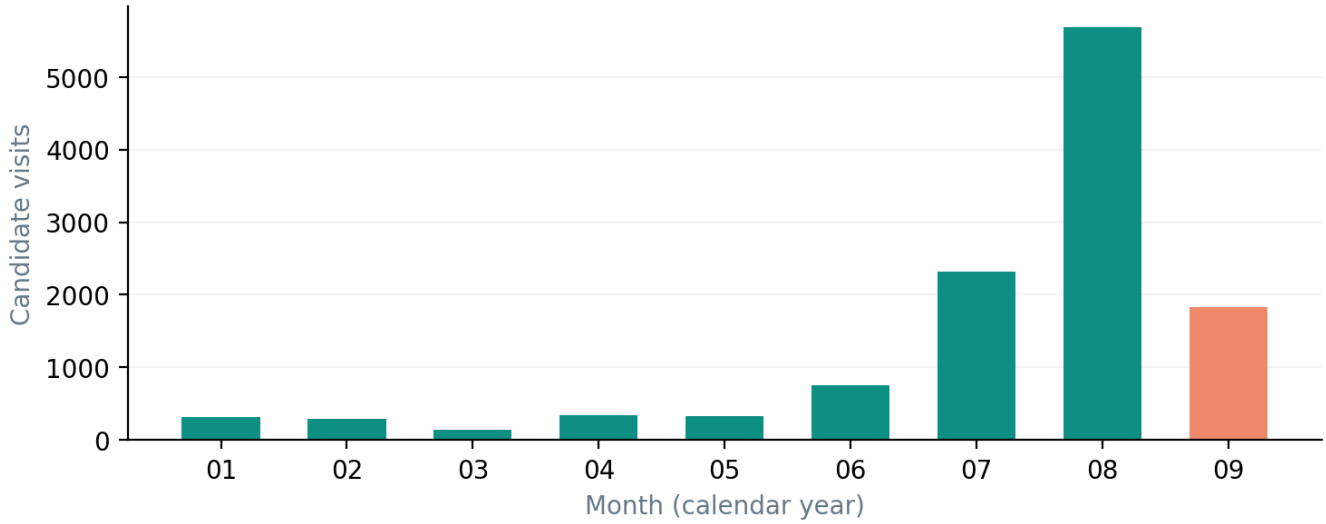

First management decision

Start the review with **Eligibility & grades**: 775 mature visits in this topic cohort have at least one response-gap, repeated-topic, or friction signal. Validate the classifications, identify recurrent questions, then test clearer guidance.

Evidence boundary: 6,147 visits have stronger admission signals and 5,869 have possible signals. Both remain unvalidated text classifications. No confirmed conversion, verified applicant identity, or reliable human/bot attribution is available.

Demand needs fair comparisons.

Measure visit starts, preserve partial-month boundaries, and avoid causal claims about campaigns or admission deadlines.

Coral marks a partial month. Counts use the first in-period customer message in each visit; missing days after the export cutoff are not zero-demand days.

Observed concentration: 2026-08 accounts for 5,685 selected visits (47.3% of the cohort). This locates workload concentration; it does not explain its cause.

Matched-period comparison

Days 1-15 of 2026-09: **1,835 visits**, versus **3,173** for the same day numbers in 2026-08. The current window is 42.2% lower. Equal day counts correct the partial-month comparison, not weekday mix, seasonal effects, campaigns, or classification error.

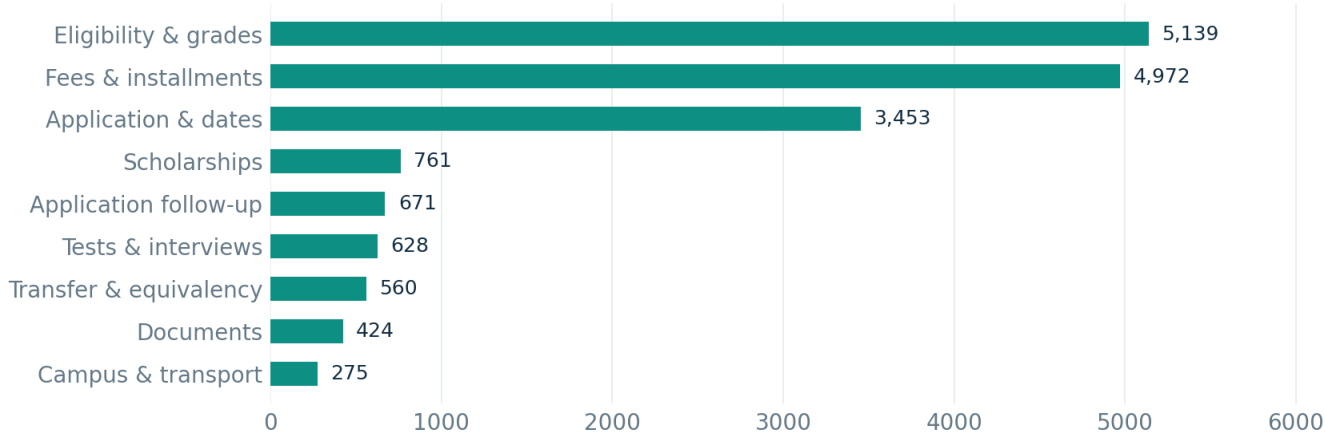

Month	Visits	Observed days	Visits / day
2026-05	329	31	10.6
2026-06	761	30	25.4
2026-07	2,319	31	74.8
2026-08	5,685	31	183.4
2026-09	1,835	15	122.3

Decision implication

Use the peak-period pattern to plan admissions content updates and escalation coverage before the next comparable cycle. Validate the current cycle's opening dates and workload ownership before changing staffing. Monitor daily volume with the same cohort definition.

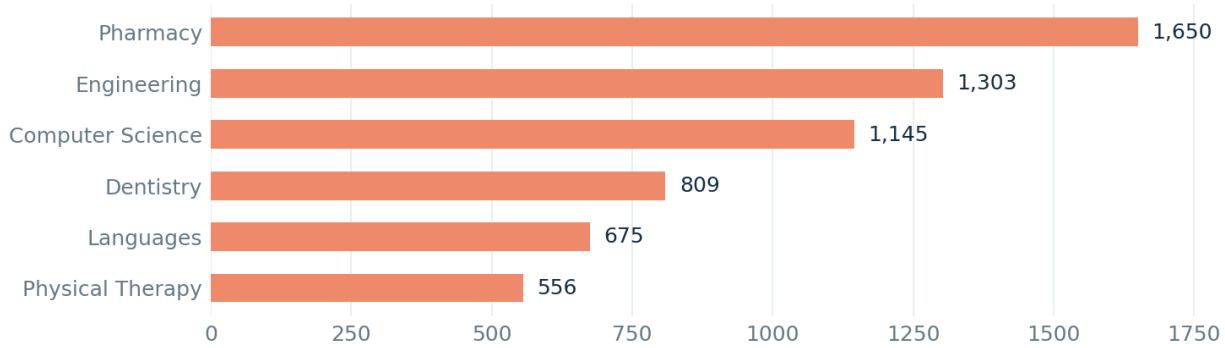

The information needs are clear.

Topics and faculties are multi-label. A single visit may appear in several bars, so shares cannot simply be added.

The combined, deduplicated reach of fees or eligibility is **8,142 visits**. This union is more useful for estimating information-guide reach than adding the two topic totals.

Faculty / discipline mentions

The top three mentioned disciplines collectively appear in 3,879 distinct selected visits (32.3%). These are text mentions, not course availability, applications, or confirmed faculty choice.

Information-design hypothesis

Test a short, certificate-specific eligibility and fee guide with a clear next step. Separate tuition, application charges, and payment instructions. Then audit later repeat inquiries and response gaps against a comparable baseline. A lower repeat rate would still need context review before being treated as improved resolution.

Speed is not answer quality.

Welcome templates are excluded by rules. Content-bearing replies remain candidates for human validation, not verified resolutions.

Reply within 24h

97.4%

11,646/11,959 mature queries

Median content reply

19 sec

Mature replied visits only

P90 content reply

1.6 min

Mature replied visits only

Response observation	Count	Interpretation
No content reply within window	313	Includes no observed reply and replies outside the window.
No observed content reply	310	No qualifying later business message in the same visit.
Recent queries excluded	57	Insufficient observation time; answered and unanswered cases excluded.

Where the response-window gaps appear

Topic cohort	Mature queries	Gap visits	Gap rate
Fees & installments	4,951	91	1.8%
Application & dates	3,423	81	2.4%
Eligibility & grades	5,116	61	1.2%
Transfer & equivalency	558	14	2.5%
Scholarships	761	13	1.7%

The topic rows overlap. Gap rates describe the topic cohort; they do not prove the reply failed to answer that specific topic. Time is elapsed UTC time, not business-hour handling time.

What to do next

Review a sample of fast replies for correctness, completeness, and a clear next step; review the no-timely-reply cohort separately for routing problems. Keep these two review tasks separate because speed and answer quality can fail in different ways.

Friction phrases occur in 484 selected visits; complaint phrases occur in 40. These are contextual flags, not validated sentiment scores or diagnosed root causes.

Prioritize observed exposure.

Rank topics by distinct mature visits with a review signal. No arbitrary weighted score, invented revenue, or conversion uplift is used.

Unique review visits

1,989

Union of gap, repeat topic, and friction

Repeated-topic messages

6,244

Observed messages, not automatically avoidable

Topic	Demand visits	Review exposure	Same-topic returns
Eligibility & grades	5,139	775	557
Fees & installments	4,972	768	472
Application & dates	3,453	722	431
Application follow-up	671	212	104
Tests & interviews	628	184	113
Scholarships	761	105	45

Exposure is deduplicated inside each topic, but topic rows overlap. A friction flag can concern another topic in the same visit. Repeated topics may reflect normal follow-up, new questions, or persistent confusion; the rule alone cannot distinguish them.

Capacity scenarios - explicitly hypothetical

Assumed reduction	Observed baseline	Hypothetical messages avoided
10%	6,244	624
25%	6,244	1,561
50%	6,244	3,122

Formula: inbound messages in same-topic return visits multiplied by an assumed reduction. The reduction is not estimated from this dataset. Rounding is for presentation only; calculations retain decimals.

Interpretation boundary

These scenarios illustrate the scale of a possible intervention, not a forecast. The export does not identify avoidable contacts, handling time, bot/human share, tuition revenue, or enrollment uplift. Labor hours should only be calculated with an explicit handling-time assumption and labelled as equivalent effort.

Applicant signals need verification.

Distinguish a stated claim from a complete applicant profile. Missing fields must not be filled through demographic guessing.

Background claim visits

528

Attributed pupil / first-person phrases

Background not captured

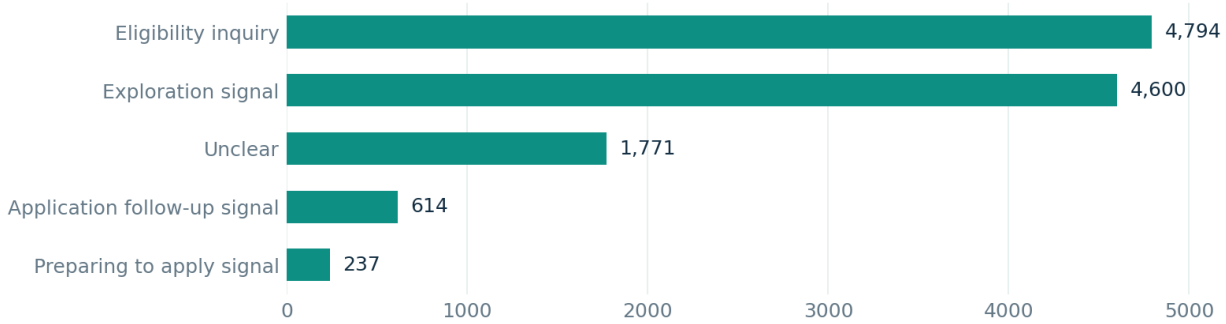

95.6%

No rule match does not prove absent information

Explicit percentage visits

313

Attributed and percentage-marked

Stages use precedence: follow-up, preparing to apply, eligibility inquiry, exploration, unclear. They describe text signals rather than a sequence of verified events. This distribution must not be drawn or interpreted as an enrollment funnel.

Background claim	Visits
Egyptian secondary	266
Technical diploma	115
Azhar	87
American diploma	76
IGCSE / British	15
STEM	10

Decision implication

Use explicitly stated certificate information to tailor answers within individual conversations. Do not use sparse text claims to estimate the entire university applicant mix, eligibility, or conversion. Request verified application records if management needs those outcomes.

A measurable plan for the next cycle.

Recommended owners and actions below are proposals. Their effect must be evaluated on a comparable follow-up cohort.

Priority	Evidence	Proposed owner	Test
Eligibility & grades	775 review-exposure visits	Admissions policy	Clarify eligibility by certificate; validate official year-specific requirements before publishing answers.
Fees & installments	768 review-exposure visits	Admissions + finance	Test a single fees-and-installments guide; distinguish tuition, application fees, and payment steps.
Application & dates	722 review-exposure visits	Admissions operations	Provide a short application checklist with deadlines and the next action at each step.

Suggested 30-day sequence

Week 1: Review category-balanced conversations for error discovery, then label an independent validation sample. Record category precision and recall. Review fast reply quality and the response-gap cohort separately.

Weeks 2-3: Test the highest-reach information changes with documented eligibility rules and clear escalation. Track repeated topics, response-window gaps, and representative answer-quality reviews; record launch dates.

Week 4: Compare equivalent windows and the same label definitions. Report changes as observational unless an experimental design supports causality. Obtain application IDs and verified outcome records before assessing enrollment impact.

Methodology that keeps the report defensible

Messages are filtered individually within the calendar-year window and capped at the declared export cutoff. Visit gaps exceed 24 hours between messages from either party. Rates use mature query visits with at least 24 hours of observation. Median and interpolated P90 exclude unanswered and recent visits.

Classifications use customer text only. Topics are multi-label. Repeated-topic flags refer to later candidate visits by a source identifier within the full reporting period. They retain that history after filters. Evidence exports are pseudonymous and omit full texts. Balanced audit samples support error discovery; their raw accuracy is not a population estimate.

Full source period: 96,562 messages; 49,102 inbound and 47,460 outbound. Source-quality counts do not change with report filters. Invalid timestamps and duplicate IDs removed: 0 and 0 respectively (all history).

Unavailable: verified conversion, resolved-case outcomes, actual applicant eligibility, reliable human/bot attribution, staff handling hours, and true unique-person counts. The analysis is conditional on the unvalidated rule labels.
